

TO ORDER CYLINDER ROD BELLOWS

First identify the type of cylinder, the most common types are tie rod (front and back flange held together by bolted rods) and welded (usually round flanged).

In order to make a bellows assembly the attachment points should be measured. The flange that mounts the cylinder to the frame and the mounting assembly to the moving plate. The rod diameter and stroke are required for the minimum ID and bellows length.

Mark up the attached drawing and fax for as quotation. Standard bellows material is **Hypelon**.
